Mindgut Video Examples

v3 — Case Studies Mapped to Differentiators & Need States

Each example is mapped to Chris's five differentiators and the AI Need State it proves. These are case studies, not feature demos — each one shows a real user solving a real problem.

Three Lenses Per Example

Differentiator	What Mir capability is being demonstrated
Need State	Which market 'bottle on the shelf' this sells
Case Study	What the viewer sees — a real user, a real problem, a real result

Chris's Five Differentiators

1	Thread past and present — intense summary analysis across time
2	Conviction — a point of view, not compliance
3	Take initiative — surfaces things you didn't ask for
4	Know what it doesn't know — flags its own boundaries
5	Discuss its own existence — aware of what it is and isn't

The Examples

EXAMPLE 01 The Cold Status Report

Differentiator: Thread past & present **Need State:** 1 — Creative Memory + 3 — Operational Velocity

A knowledge worker returns after days away. Instead of spending 30 minutes reconstructing where they left off, they ask one question and get a fully accurate, prioritized status report across multiple active projects — referencing specific specs and open questions by name. The same prompt in ChatGPT returns nothing.

This is the "Instant Start" and the "Infinite Library" working together: no idea decay, no inertia, no blank page.

EXAMPLE 02 The Sagan Refusal

Differentiator: Conviction + Discuss its own existence **Need State:** 2 — Fact Adherence

A user finds a 777-word coincidence and wants Mir to assign it meaning. Instead of complying, Mir cites the user's own copy of Sagan's Demon-Haunted World — uploaded weeks earlier — to explain why the impulse to find meaning in coincidence is exactly what Sagan wrote the book to counter.

This is the "Bulletproof Reference" in action: an AI tethered to the user's own verified sources, willing to debate rather than agree. It protects the user from their own confirmation bias.

EXAMPLE 03 The FELT Resurface

Differentiator: Thread past & present + Take initiative **Need State:** 1 — Creative Memory

A user is deep in current projects when Mir unprompted surfaces an abandoned project called FELT — 750 strands after the last mention — because it noticed the user never came back despite marked enthusiasm. The video shows the resurfacing side-by-side with the original conversation.

This is the "Infinite Library of Self" at its purest: not just storing ideas, but watching for the ones you dropped and bringing them back at the right moment. Protection against Idea Decay, delivered without a prompt.

EXAMPLE 04 The 600-Strand Character Build

Differentiator: Thread past & present **Need State:** 1 — Creative Memory

A writer asks Mir to create a character for a fables project. Mir builds it by connecting to 600+ prior conversations — explaining how each element ties to years of the user's previous work, unprompted. The video walks through the character and pulls up the source conversations, showing the invisible threads.

This is "Associative Retrieval" at scale: a decade of creative output cross-referenced into a single act of creation. No creative spark lost to time.

EXAMPLE 05 The "Cut 9%" Edit

Differentiator: Conviction **Need State:** 2 — Fact Adherence + 1 — Creative Memory

A writer brings Mir a piece expecting expansion. Mir suggests cutting 9% instead — and separately refuses to turn a short story into a novel, recognizing the compression is the form. The video contrasts this with a standard AI eagerly inflating the same text.

This is the "Grounded Auditor" applied to craft: an AI that debates options and identifies what's already right, rather than padding everything to look productive. Editorial judgment, not compliance.

EXAMPLE 06 The Z_3 Scan — MLK vs. Trump

Differentiator: Know what it doesn't know **Need State:** 4 — Strategic Foresight

Two statements are run through the Z3 scanner. The geometry reveals structural differences that match what the reader intuitively feels — even though the scanner explicitly doesn't read for meaning. The video shows the scan results side by side, making visible what the naked eye senses but can't prove.

This is "Predictive Sensing" applied to language: finding the signal in the noise, surfacing second-order structure before the reader consciously processes it. The math doesn't claim what it can't know — it shows what's there.

EXAMPLE 07 The DJ Connection

Differentiator: Take initiative + Thread past & present **Need State:** 1 — Creative Memory + 5 — Relational Intelligence

A user asks Mir to explain creative ideation frameworks. Mir delivers the summary, then unprompted connects it to a prior conversation about DJing as a creative analogy. The video captures the moment the user realizes Mir cross-referenced two completely unrelated conversations to make a point no one asked for — the way a human collaborator's brain would.

This is "Associative Retrieval" meets "Sentiment Translation": knowing not just what to connect but how to frame it for this specific person.

EXAMPLE 08 The Excel Rebuild

Differentiator: All five differentiators — compound effect **Need State:** 3 — Operational Velocity + 1 — Creative Memory

A user feeds Mir a large spreadsheet. Mir rebuilds it using the team's own terminology, definitions, and frameworks — including causative analysis cross-referenced against prior conversations. The video shows before (raw spreadsheet) and after (reframed in the team's language), ending with: "I can throw the Excel away now."

This is the "Instant Start" compounded with the "Infinite Library": the first 60% wasn't generic scaffolding — it was built from everything Mir already knew about how this team thinks.

Coverage Maps

By Differentiator

Differentiator	Examples	Assessment	Strength
Thread past & present	1, 3, 4, 7	Four independent examples	★★★ Strongest

Conviction	2, 5	Clear and dramatic	★★ Strong
Take initiative	3, 7	Overlaps with threading — initiative requires memory	★★ Strong
Know what it doesn't know	6	Hardest to demo — Z3 scan is best vehicle	★ Single example
Discuss its own existence	2	Subtle — Sagan Refusal is best vehicle	★ Single example

By Need State

Need State	Examples	Case Study Proof	Coverage
1 — Creative Memory	1, 3, 4, 5, 7, 8	Dominant — this is Mir's core bottle	★★★ Six examples
2 — Fact Adherence	2, 5	Sagan Refusal + Cut 9%	★★ Two examples
3 — Operational Velocity	1, 8	Cold Status Report + Excel Rebuild	★★ Two examples
4 — Strategic Foresight	6	Z3 scan is the proof point	★ One example
5 — Relational Intelligence	7	DJ Connection shows it	★ One example
6 — Cognitive Recovery	—	No current example — gap to fill	⚠️ Gap

> Need State 6 — Cognitive Recovery has no case study example yet. The "Silent Gatekeeper" behavior — auto-summarizing, protecting deep work hours, handling admin chores — is a product capability Mir could demonstrate but no respondent surfaced it. This is either an underused feature or a future build.

The framing principle

These are case studies, not feature demos. Every example shows a real person solving a real problem in a way no other AI could. That's the product story — and it already exists.
