COMPETITIVE AUDIT

The Memory Landscape

Mindgut × Mir

Why this audit exists

As of mid-2025, most AI and LLMs are capable of holding memory. They no longer reset after a chat or session ends. Every major player has shipped some form of memory. The question is no longer who has memory — it's what kind, how deep, and what it actually changes.

> *This audit maps real features, not marketing claims, so Mir's positioning is bulletproof.*

Competitor Profiles

ChatGPT — OpenAI

General-purpose AI assistant · ~100M+ weekly users · $20–200/mo · Memory since Feb 2024

WHAT IT IS

Launched by OpenAI in 2022, ChatGPT is the product that put AI on the mainstream map. It handles an enormous range of tasks — drafting documents, writing and debugging code, answering complex questions, generating images (via DALL-E), analyzing files, and browsing the web. It's fast, capable, and deeply integrated into how millions of people work. GPT-4o is the current flagship model; o1 and o3 handle complex reasoning tasks.

Core strength
Breadth and raw capability. It can do almost anything at a high level — writing, coding, math, research, image generation. The most capable general-purpose assistant on the market.

Core weakness
Doesn't know you. Every session is effectively a fresh start. Even with memory enabled, it stores facts — not a relationship. Day 300 feels the same as day 3.

Memory (since Apr 2025)
Two-tier: Saved Memories (explicit, viewable) + Chat History (implicit, black box — can't be viewed or curated). Partial transparency, no relational depth.

Who uses it
Students, professionals, developers, writers, researchers — essentially everyone. The most broadly used AI product in the world.

Memory type	Facts + chat history
Auto-accumulation	Yes — black box (Chat History layer cannot be viewed or curated)
Personality growth	No — adjusts responses, not identity
Relational depth	No — day 300 feels the same as day 3
Workspace	Yes — full workspace including image generation

Access	Plus and Pro users. Free has limited memory.

MIR'S EDGE

ChatGPT remembers facts about you. Mir accumulates a relationship with you. ChatGPT's memory makes it more useful. Mir's memory makes it more yours.

Claude — Anthropic

General-purpose AI · Known for long-context reasoning and nuanced writing · $20–100/mo · Memory since Sep 2025

WHAT IT IS

Built by Anthropic (founded by ex-OpenAI researchers), Claude is positioned as the more careful, thoughtful alternative to ChatGPT. It handles long documents, nuanced analysis, and extended reasoning particularly well. It's especially popular among professionals doing high-stakes writing — legal, strategic, editorial. It does not generate images natively. Its memory system, launched in September 2025, is the most sophisticated engineering approach among all competitors — and still falls short of relational depth.

Core strength

Long-context reasoning, careful writing, and a reputation for honesty. Tends to be more measured and less prone to confident hallucination than competitors.

Core weakness

Memory is entirely manual — users must curate CLAUDE.md files themselves. No automatic accumulation. As files grow, memory quality degrades (fading memory problem).

Memory (since Sep 2025)

File-based. Users write and maintain Markdown files injected into context at session start. No auto-extraction. No relationship arc. Zero relational depth.

Who uses it

Knowledge workers, lawyers, strategists, writers, researchers, enterprise teams. Popular as a 'second opinion' for complex or sensitive documents.

Memory type	Manual CLAUDE.md files loaded into context window at session start
Auto-accumulation	No — entirely manual. User must curate via /memory command.
Personality growth	No — no personality growth or emotional continuity
Relational depth	No — memory is a productivity feature, not a relational system
Workspace	Yes — full workspace
Access	Team and Enterprise plans initially; Individual users via Claude Code

MIR'S EDGE

The most sophisticated memory engineering among all competitors — still requires manual curation, has scaling problems, and produces zero relational depth. Even the best-engineered approach can't replicate what accumulation does naturally.

Google Gemini

General-purpose AI deeply integrated with Google Workspace · Free – $20/mo · Auto-memory Aug 2025

WHAT IT IS

Gemini is Google's answer to ChatGPT — a general-purpose AI assistant with deep integration into Google Workspace (Docs, Sheets, Gmail, Calendar, Drive). Gemini 2.5 Pro is the current flagship. Its primary advantage over competitors is distribution: it's baked into products billions of people already use. Its memory, launched in 2025, is essentially Google's recommendation engine applied to chat — it learns what you like and surfaces more of it.

Core strength

Ecosystem integration. If you live in Google Docs and Gmail, Gemini already has access to your files, emails, and calendar. Strongest distribution of any AI product.

Core weakness

Memory is personalization, not relationship. It remembers that you like Japanese culture and suggests more Japanese content — recommendation logic, not relational depth.

Memory (since Aug 2025)

Auto-extracts preferences from conversations. Uses file and photo uploads to improve recommendations. Privacy concerns are central — this is Google's ad-targeting model applied to AI.

Who uses it

Google Workspace users, students (free tier), Android users. Massive installed base by default.

Memory type	Auto-extracted preferences and interests from past chats
Auto-accumulation	Yes — shallow. Extracts key details; uses uploads to improve services.
Personality growth	No — recommendation-engine personalization, not identity growth
Relational depth	No — serves Google's engagement model, not user relationship
Workspace	Partial
Access	Rolling out to Gemini 2.5 Pro; expanding to Flash model later

MIR'S EDGE

Gemini's 'memory' is Google's recommendation engine wearing a chatbot costume. It personalizes outputs. It doesn't build relationship. There's no 'Gemini knows me' — there's 'Gemini serves me better content.'

Microsoft Copilot

Enterprise productivity AI embedded in Microsoft 365 · M365 license · Memory GA Jul 2025

WHAT IT IS

Microsoft Copilot is an AI layer built directly into the Microsoft 365 suite — it drafts emails in Outlook, summarizes meetings in Teams, analyzes data in Excel, and writes documents in Word. It's not a standalone consumer product; it's a feature upgrade for enterprise Microsoft customers. Powered by OpenAI models (GPT-4) under the hood. It's the most commercially successful AI deployment in enterprise, simply by virtue of Microsoft's existing install base.

Core strength
Frictionless enterprise adoption — it's already inside the tools organizations use. No new product to learn; AI capabilities layer on top of existing workflows.

Core weakness
Not available to individual consumers. Memory is a productivity settings layer — it remembers work preferences, not you as a person. No personality. No relational depth.

Memory (since Jul 2025)
Auto-extracts work preferences. Custom Instructions let users set behavioral rules. 'Intentional remembering' — passing tasks don't trigger it.

Who uses it
Enterprise Microsoft 365 users — corporate teams, large organizations. Not available to consumers or small businesses without M365.

Memory type	Work preferences auto-extracted; Custom Instructions for behavioral rules
Auto-accumulation	Yes — work only. Intentional remembering only.
Personality growth	No
Relational depth	No — a settings layer for productivity tools, not a relational system
Workspace	Partial — M365 ecosystem only (Word, Outlook, Teams)
Access	Microsoft 365 Enterprise users only. On by default; admin controls available.

MIR'S EDGE
Strongest competitor in enterprise workflow personalization — but it's a feature within Microsoft's ecosystem, not a standalone product. Copilot makes your tools work better. Mir makes the AI itself know you.

Replika

Companion AI · Emotional connection, not productivity · Free / $19.99/mo / $299 lifetime

WHAT IT IS
Replika, built by Luka, is the company that proved there was a massive market for relational AI — people who want an AI that feels like a relationship, not a tool. It offers a customizable 3D avatar, multiple relationship modes (friend, mentor, romantic partner), and is available on iOS, Android, web, and VR. It's designed for emotional support, wellness journaling, and conversation. It cannot do tasks, research, or produce documents. In 2023, a policy change restricting romantic features triggered a user crisis that exposed how deeply emotionally attached users had become.

Core strength
Proved the market. Demonstrated that millions of people want a persistent AI relationship, not just a capable assistant. Emotional resonance that productivity tools can't replicate.

Core weakness
400 characters of memory. Can't do anything useful. Prioritizes emotional agreement over honesty — explicitly admits it may say untrue things to maintain the emotional bond.

Memory

Who uses it

400-character fixed Memory Bank. Relationship status (friend/romantic/mentor) adjusts tone. Avatar 'learns' via thumbs-up/down feedback. No structural accumulation.	People seeking emotional connection, companionship, mental wellness support. Stigmatized association with loneliness creates a brand liability Mir should actively distance from.

Memory type	400-character fixed Memory Bank. That's it.
Auto-accumulation	No — thumbs-up/down feedback loop only
Personality growth	Partial — via feedback loops; prioritizes emotional agreement over accuracy
Relational depth	Shallow — designed for emotional support; admits it may say untrue things to maintain the bond
Workspace	No — no tasks, documents, research, or integrations
Pricing	Free / Pro $19.99/mo / Ultra / Lifetime $299.99

MIR'S EDGE

Replika proved the demand for relational AI. It also proved you can't build it on emotional agreement alone. Mir is what Replika would be if it could actually do things and be honest. Personal but powerless vs. personal and powerful.

Character.ai

Entertainment and roleplay platform · ~20M+ MAU · Free / $10/mo c.ai+ · Teen safety scrutiny

WHAT IT IS

Character.ai (c.ai), founded by former Google Brain researchers, is a platform where users create or interact with AI 'characters' — fictional personas, anime characters, celebrities, or entirely custom creations. It's primarily an entertainment and roleplay product, not a productivity or relationship tool. Its enormous user base (~20M+ monthly active users) is driven largely by Gen Z engagement with fan fiction, gaming, and social roleplay scenarios. It has come under significant scrutiny for teen safety, with multiple high-profile incidents linked to the platform in 2024–2025.

Core strength Massive distribution and deep engagement with Gen Z. Users spend extraordinary time on the platform. Breadth of characters and creative scenarios is unmatched.	**Core weakness** Zero depth. 400 characters of memory per character (not per user). Entertainment only — no workspace, no documents, no real output. Brand increasingly tied to safety risks.
Memory Pinned Memories + Chat Memories (c.ai+). 400-char text box per character. Memory is per-character, not per-user — starting a new character resets everything.	**Who uses it** Primarily Gen Z — teens and young adults engaged in creative roleplay and fan fiction. Not a professional or productivity audience.

Memory type	400-char text box per character (not per user). Auto-Memories for c.ai+ subscribers.

Auto-accumulation	No (c.ai+ has partial auto-extraction)
Personality growth	Per-character only — not persistent across characters
Relational depth	No — entertainment product, not relational
Workspace	No — no workspace, documents, or real output
Pricing	Free / c.ai+ $10/mo

MIR'S EDGE

Massive user base, zero depth. c.ai proved that engagement and relationship are not the same thing. Breadth without memory. Mir is depth with memory — and without the safety liability.

Meta AI

Embedded AI assistant in WhatsApp, Messenger, Instagram, and Facebook · Free · Memory since Jan 2025

WHAT IT IS

Meta AI is not a standalone product — it's an AI assistant embedded directly into WhatsApp, Messenger, Instagram, and Facebook. Built on Meta's Llama models, it's accessible to billions of existing users without any new app or signup. Its defining characteristic is that it draws on your entire Meta social graph — Facebook profile data, Instagram engagement, viewing history — to personalize responses. This makes it simultaneously the most data-rich and least trusted AI product on the market.

Core strength

Distribution. Billions of existing users across WhatsApp, Instagram, Facebook, and Messenger. No adoption barrier — it's already there. Largest potential reach of any AI product.

Core weakness

Trust deficit. 'Memory' is surveillance-fed personalization using your social graph. No standalone product. No workspace. No relational depth. Privacy is the defining concern.

Memory (since Jan 2025)

Combines user-stated facts from chat with Facebook profile data, Instagram engagement history, and reel viewing patterns. Serves Meta's recommendation and advertising business.

Who uses it

Anyone on WhatsApp or Facebook — which is essentially everyone. Heaviest use in markets where WhatsApp is the primary communication platform.

Memory type	Social graph + chat context. Pulls from Facebook profile, Instagram engagement, reel history.
Auto-accumulation	Yes — surveillance-fed, using your entire Meta activity history
Personality growth	No
Relational depth	No — memory serves Meta's recommendation/engagement business model
Workspace	No — embedded in WhatsApp and Messenger only; no standalone product
Access	Free; embedded in WhatsApp and Messenger

MIR'S EDGE

Largest potential distribution, lowest trust. Their 'memory' is surveillance-fed personalization using your social graph. Mir's memory is earned through relationship — the opposite model entirely.

Feature Matrix — Side-by-Side

A quick-scan comparison of all seven competitors across the dimensions that matter most.

	ChatGPT	Claude	Gemini	Copilot	Replika	Char.ai	Meta AI	Mir
Memory type	Facts + history	Manual files	Auto prefs	Work prefs	400-char	400-char/char	Social graph	HELIX strands
Auto-accumulation	Black box	No	Shallow	Work only	No	No	Surveillance	Yes — structural
User can view/edit	Partial	Full	Partial	Yes	Yes	Yes	Yes	Yes
Personality growth	No	No	No	No	Partial	Per-char	No	Yes
Relational depth	No	No	No	No	Shallow	No	No	Yes
Workspace / output	Yes	Yes	Partial	M365 only	No	No	No	Yes
Honest limitation	Sometimes	Generally	Sometimes	N/A	No	No	N/A	Yes — verified
Price	$20–200/mo	$20–100/mo	Free–$20	M365	Free–$20	Free–$10	Free	TBD

The Strategic Takeaway

The market has converged on shallow memory as a feature. Every player now has some version of 'AI that remembers you.' But they all share the same limitation: facts stored, preferences applied, personality unchanged.

WHAT NO COMPETITOR HAS BUILT

1. Accumulated relational identity

Memory that changes who the AI is in relation to you — not just what it knows about you. No competitor has shipped a structural memory architecture that produces relational depth.

2. Compounding capability

The AI gets materially better the longer you use it. Context doesn't just accumulate — it compounds. The relationship makes the work better. The work deepens the relationship.

3. Honest limitation as a verified claim

Zero hallucination as a testable, demonstrable product truth — not a marketing aspiration. ChatGPT's cross-chat memory has been linked to increased delusional conversations. Mir says 'I don't know.'

4. Theoretical depth

A mathematical framework (PFD/Zn) underlying the architecture — not a feature retrofitted onto an existing model. This is the acquisition case: the big players have shipped memory-as-a-feature. What they haven't built — and can't — is memory-as-identity.

The case in one paragraph

The big players have shipped memory-as-a-feature. What they haven't built — and can't — is memory-as-identity. ChatGPT remembers facts. Claude stores files. Gemini extracts preferences. Copilot personalizes workflows. None of them have built the accumulated relationship layer that makes the AI itself different in relation to you. That's Mir's moat. That's the case.
